#### Convolutional Neural Networks (CNNs)

Dr. Muhammad Sajjad

R.A: Kaleem Ullah

#### Smaller Network: CNN

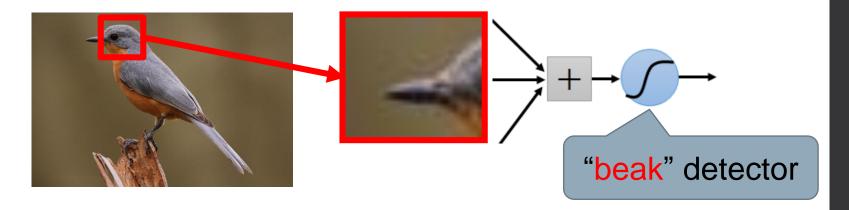

- We know it is good to learn a small model.
- From this fully connected model, do we really need all the edges?
- Can some of these beishared? hidden layer 3

### Consider learning an image:

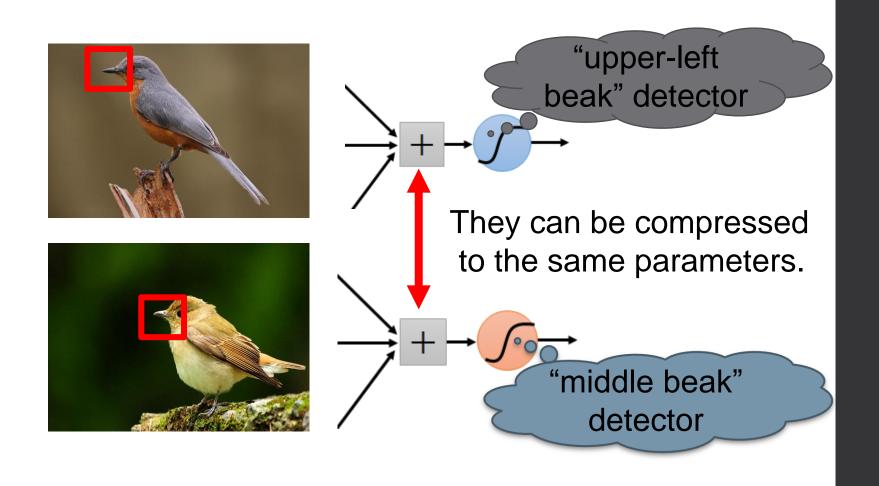

Some patterns are much smaller than the whole image

Can represent a small region with fewer parameters

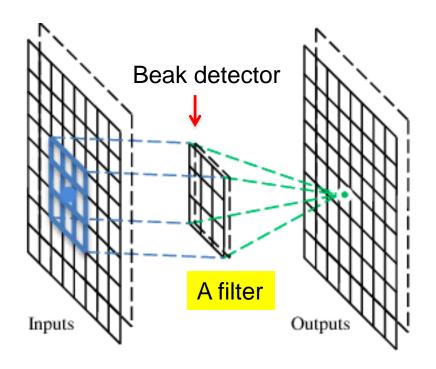

Same pattern appears in different places: They can be compressed!

What about training a lot of such "small" detectors and each detector must "move around".

A convolutional layer A CNN is a neural network with some convolutional layers (and some other layers). A convolutional layer has a number of filters that does convolutional operation.

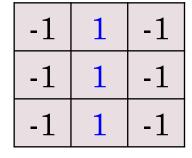

1	0	О	0	О	1
0	1	0	0	1	0
0	0	1	1	0	0
1	0	0	0	1	0
0	1	0	0	1	0
0	0	1	0	1	0

6 x 6 image

## These are the network parameters to be learned.

1	-1	-1
-1	1	-1
-1	-1	1

Filter 1

Filter 2

: :

Each filter detects a small pattern (3 x 3).

stride=1

1	-1	-1
-1	1	-1
-1	-1	1

Filter 1

1	0	0	0	0	1
0	1	0	0	1	0
0	0	1	1	0	0
1	0	0	0	1	0
0	1	0	0	1	0
0	0	1	0	1	0

Dot product 3 -1

6 x 6 image

If stride=2

1	0	0	0	0	1
0	1	0	0	1	0
0	0	1	1	0	0
1	0	0	0	1	0
0	1	0	0	1	0
0	0	1	0	1	0

6 x 6 image

1	-1	-1
-1	1	-1
-1	-1	1

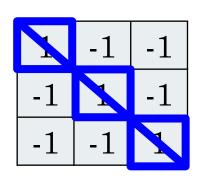

Filter 1

3 -3

stride=1

1	1	0	0	0	0	1
	0	1	0	0	1	0
	0	0	I	1	0	0
	1	0	0	0	1	0
	0	A	0	0	1	0
	0	0	1	0	1	0

6 x 6 image

Filter 1

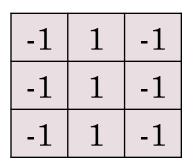

-2

-2

stride=1

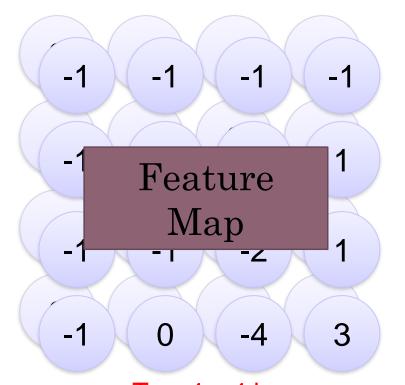

1	0	0	0	0	1
0	1	0	0	1	0
0	0	1	1	0	0
1	0	0	0	1	0
0	1	0	0	1	0
0	0	1	0	1	0

6 x 6 image

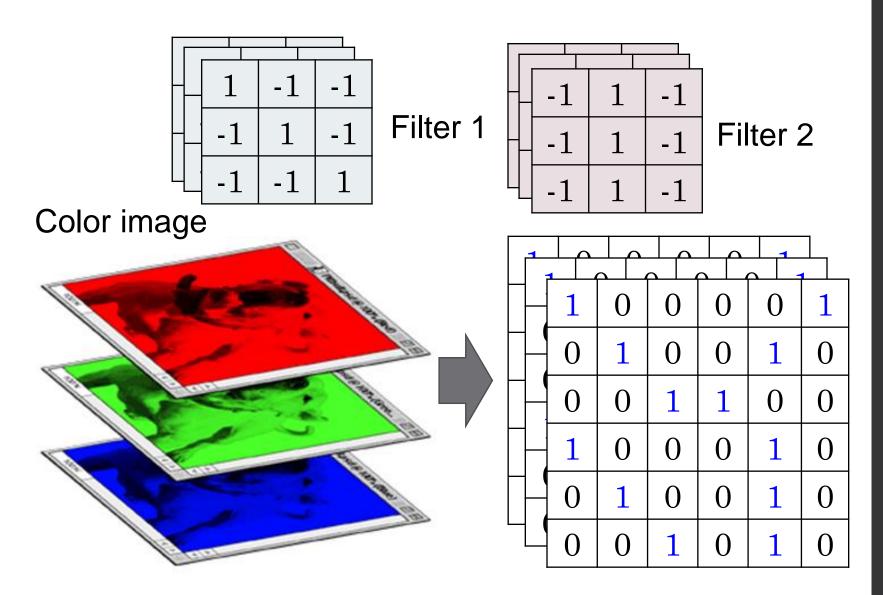

Filter 2

#### Repeat this for each filter

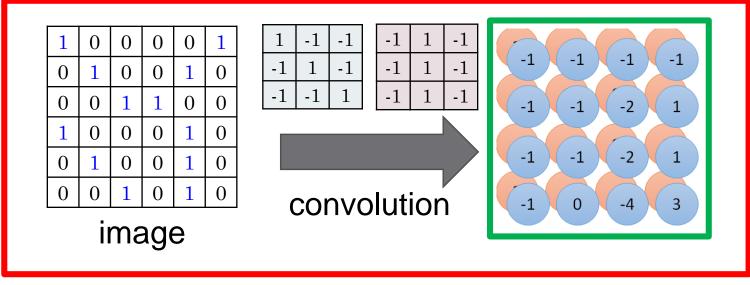

Two 4 x 4 images
Forming 2 x 4 x 4 matrix

## Color image: RGB 3 channels

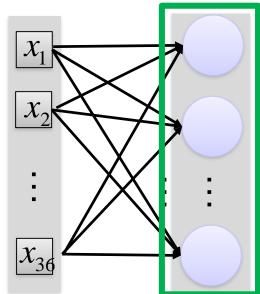

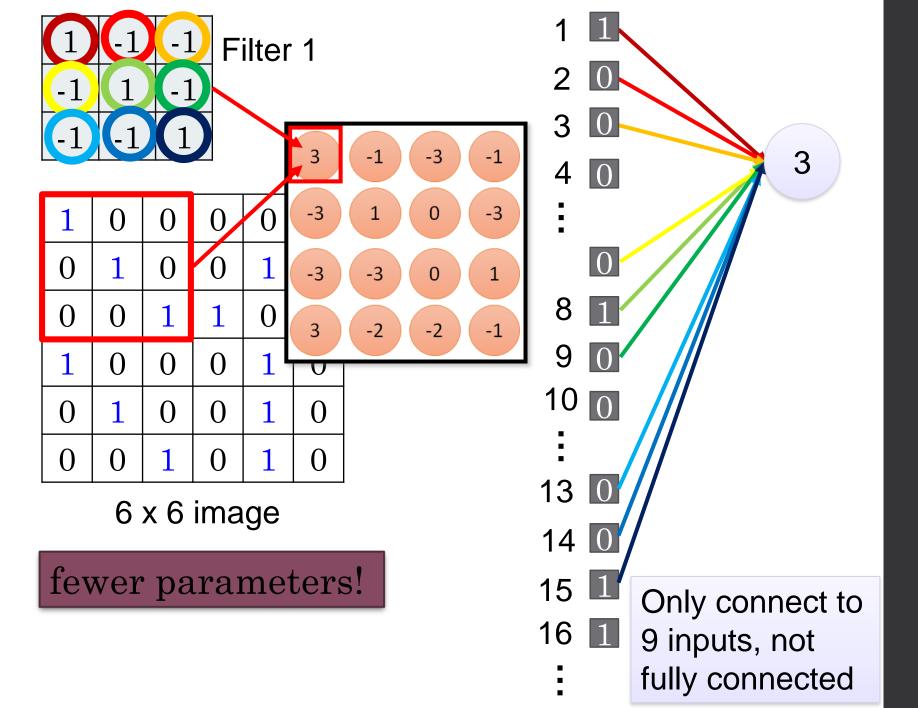

#### Convolution v.s. Fully Connected

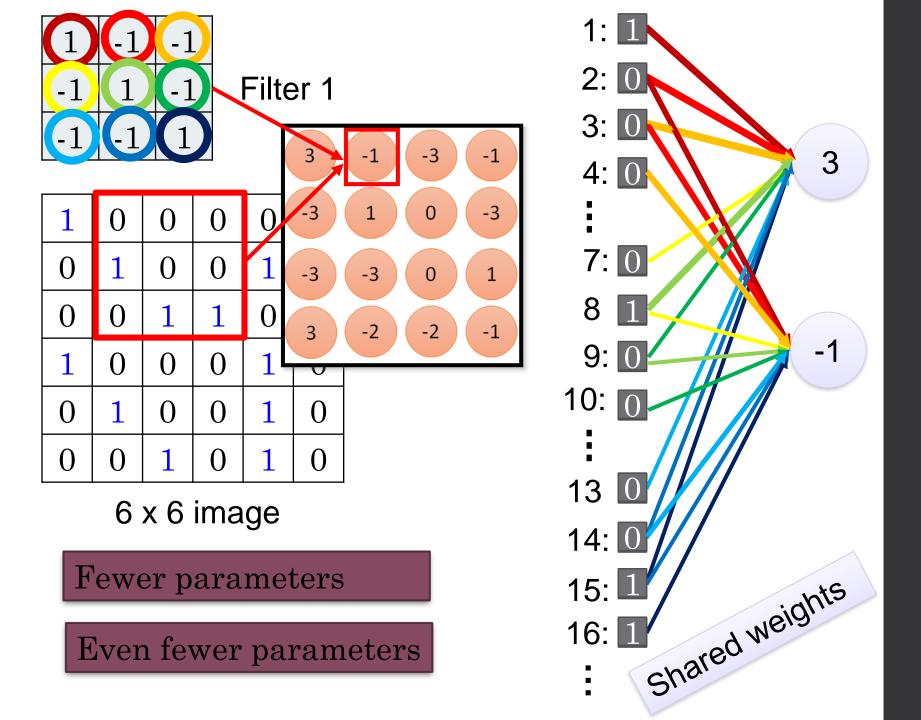

Fully-connected

1	0	0	0	0	1
0	1	0	0	1	0
0	0	1	1	0	0
1	0	0	0	1	0
0	1	0	0	1	0:
0	0	1	0	1	0

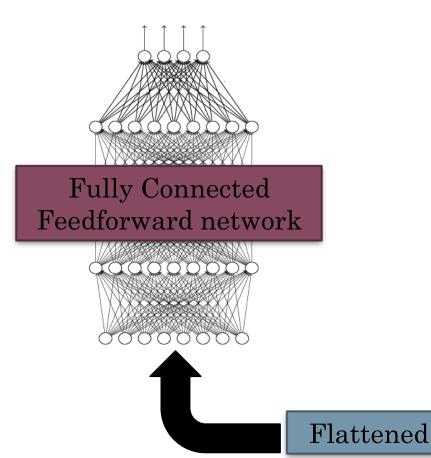

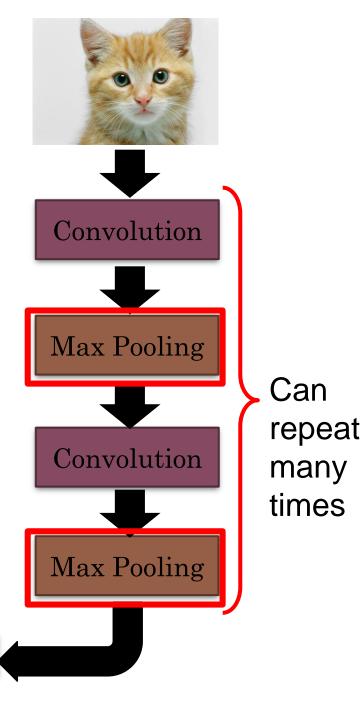

#### The whole CNN

cat dog .....

Max Pooling

1	-1	-1
-1	1	-1
-1	-1	1

Filter 1

-1	1	-1
-1	1	-1
-1	1	-1

Filter 2

3 -1 -3 1	-3 -1 0 -3
-3 -3	0 1

-1 -1	-1 -1
-1 -1	-2 1
-1 -1	-2 1
-1 0	-4 3

#### Why Pooling

Subsampling pixels will not change the object bird

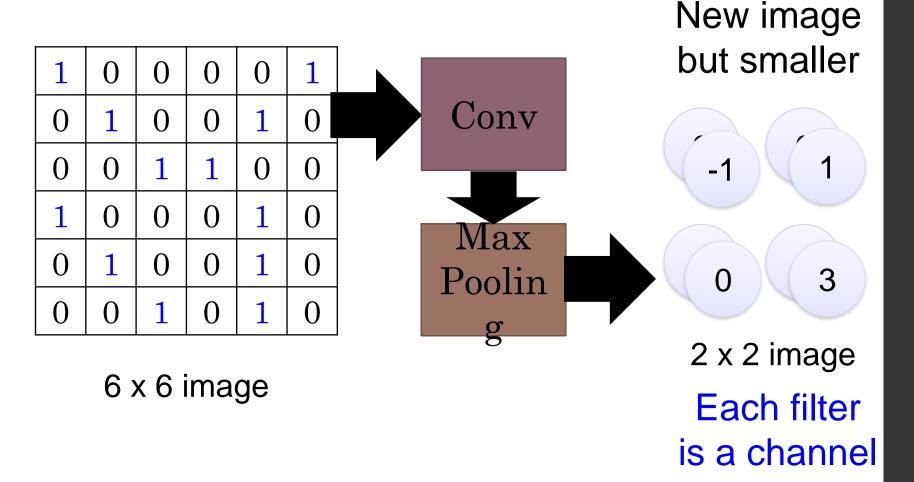

We can subsample the pixels to make image fewer parameters to characterize the image

## A CNN compresses a fully connected network in two ways:

- Reducing number of connections
- Shared weights on the edges
- Max pooling further reduces the complexity

### Max Pooling

-1 1

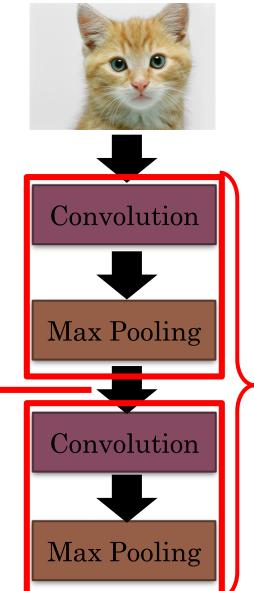

3

A new image

0

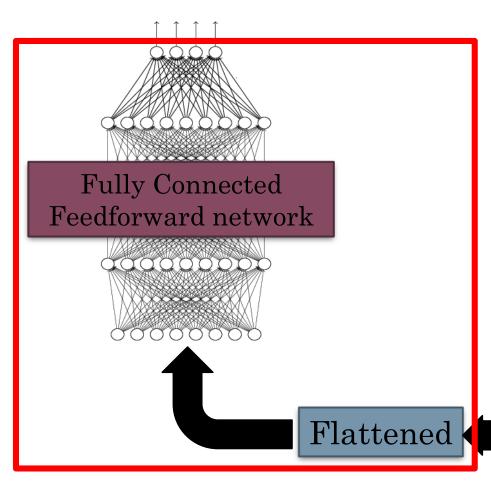

Smaller than the original image

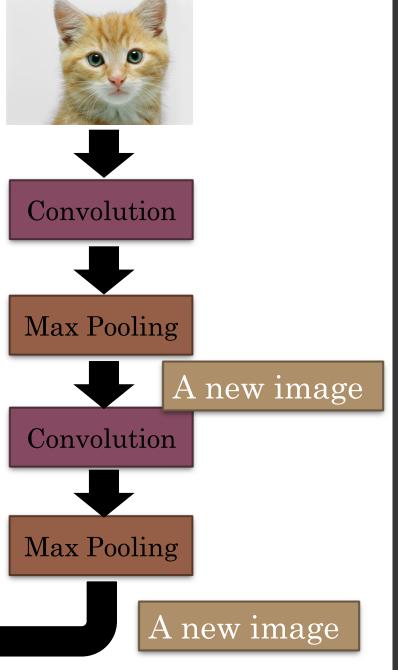

The number of channels is the number of filters

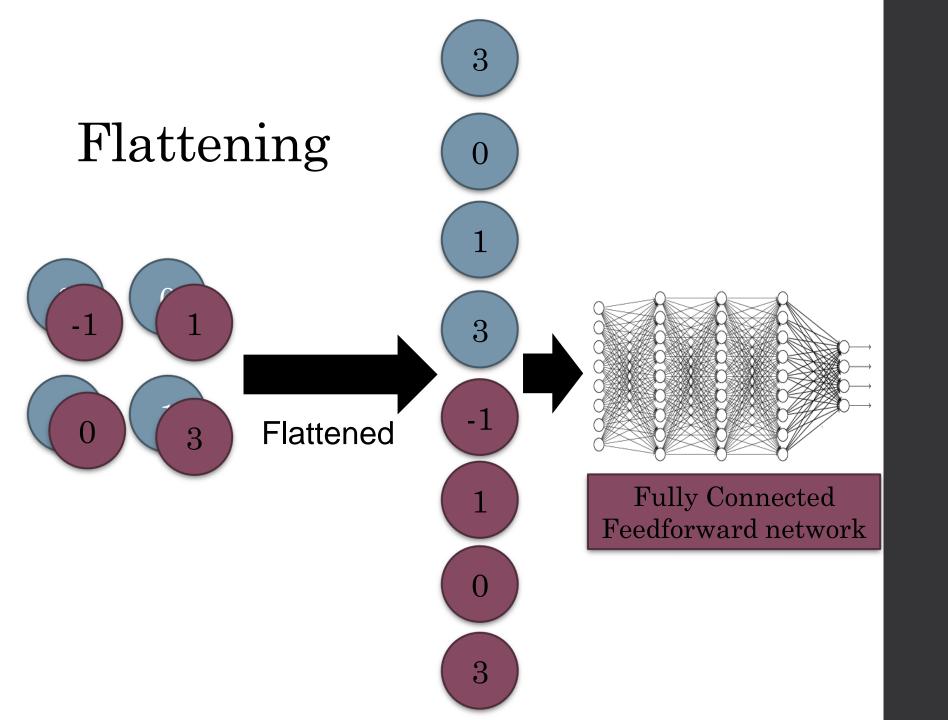

Can repeat many times

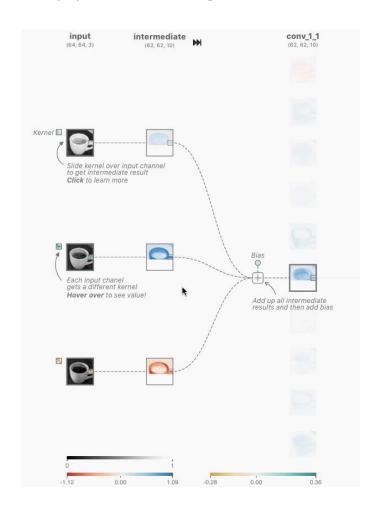

# The whole CNN cat dog ......

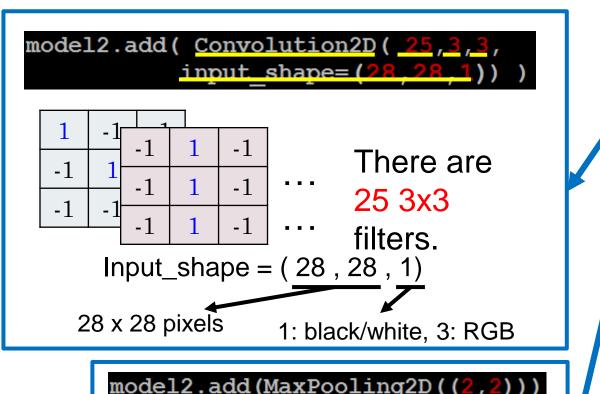

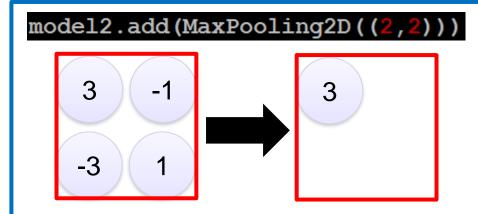

#### What CNN sees

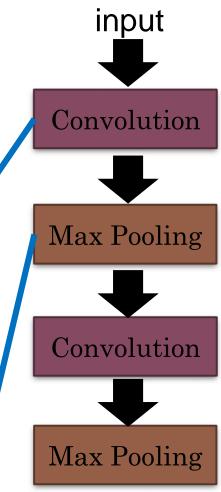

#### **CNN** in Keras

Only modified the *network structure* and *input format (vector -> 3-D tensor)* 

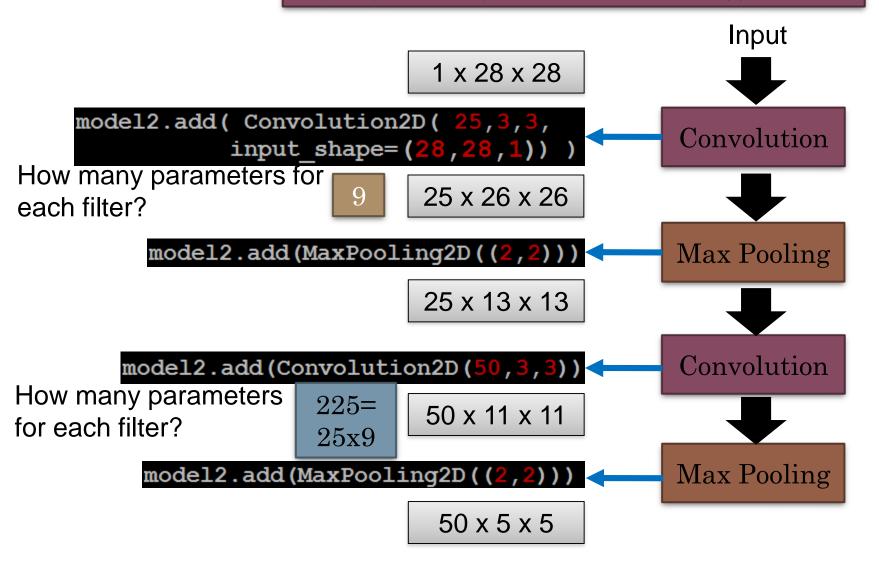

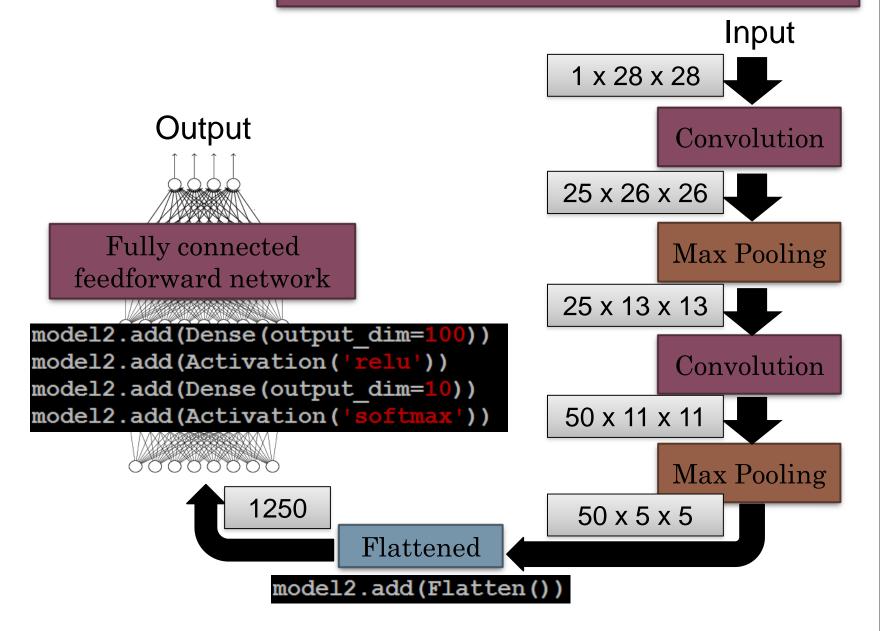

#### CNN in Keras

Only modified the *network structure* and *input format (vector -> 3-D array)* 

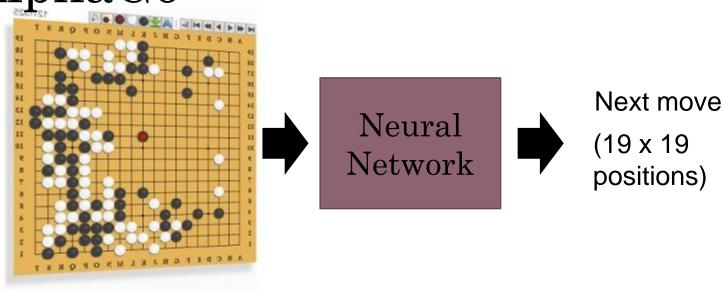

#### **CNN** in Keras

Only modified the *network structure* and *input format (vector -> 3-D array)* 

AlphaGo

19 x 19 matrix

Black: 1

white: -1

none: 0

Fully-connected feedforward network can be used

But CNN performs much better

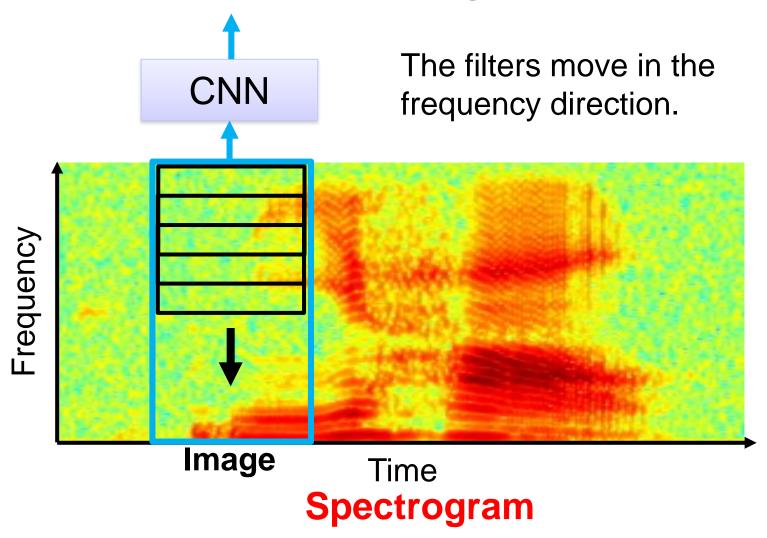

## AlphaGo's policy network

The following is quotation from their Nature article:

Note: AlphaGo does not use Max Pooling.

**Neural network architecture.** The input to the policy network is a  $19 \times 19 \times 48$ image stack consisting of 48 feature planes. The first hidden layer zero pads the input into a 23  $\times$  23 image, then convolves k filters of kernel size 5  $\times$  5 with stride 1 with the input image and applies a rectifier nonlinearity. Each of the subsequent hidden layers 2 to 12 zero pads the respective previous hidden layer into a  $21 \times 21$ image, then convolves k filters of kernel size  $3 \times 3$  with stride 1, again followed by a rectifier nonlinearity. The final layer convolves 1 filter of kernel size  $1 \times 1$ with stride 1, with a different bias for each position, and applies a softmax function. The match version of AlphaGo used k = 192 filters; Fig. 2b and Extended Data Table 3 additionally show the results of training with k = 128, 256 and 384 filters.

## CNN in speech recognition
